

Upholstery Cleaning Product Usage

Upholstery Cleaning Product Usage

The Electrodry Upholstery Cleaning system is a unique process that achieves excellent cleaning results on almost all fabrics.

Chemical usage

Dry-Solve E – Applied to the fabric before the application of moisture. Spray on or apply with a cloth (do not mix with water) and wipe off

Electro-2 – used on cotton or linen fabrics before cleaning to set colours or help prevent cellulosic browning. Mix 1 part water to 1 part electro-Shield and apply 100ml of the diluted Electro-2 solution per seating position. Agitate with a brush after application

Electro-1 – Applied as a high performance cleaner on areas of the lounge with oily soil build-up. Apply neat in a fine mist. Overapplication may unset dyes or promote cellulosic browning

Performance Plus (Concentrate for franchisees): A neutral upholstery cleaning prespray. Dilute with water 1:30 and apply to the fabric, agitate with a horse-hair brush and allow 10 minutes dwell time before cleaning

Platinum Plus (Concentrate for Electrodry employees) - A neutral upholstery cleaning prespray. Dilute 1:1 and apply to the fabric, agitate with a horse-hair brush and allow 10 minutes dwell time before cleaning

Electro-Shield: Dilute 1:10 with water 100ml per seating position. Agitate into fabric after application
